EE 021 Midterm Project Report

Name: Anthony Gollihar

Student ID: 255220877

Project Title:

List 2-3 objectives of your project (in bullet points)

1. Interpret input resistances and voltage
2. Produce a graph of values created by inputs
3. Create or read .txt files with values for resistances and voltages

List the main Python programming features (at least two) that you explored in your project with a description of how and why you implemented these features:

1. Importing modules
2. Reading/writing files
3. Storing variables with functions to optimize code

What is the **one thing that is unique about your project? (1-2 sentences)**

Answer: You can input as many resistors as you want without an error occurring.

What are possible parts of Python code that will constitute for "significant work" on the project? Think about the programming that you did for the project that was not part of the project milestones. (2-3 sentences)

Answer: The number of graphs that are creatable are what caused significant work. Creating a program that could only produce voltage/current graphs would've satisfied the requirements, but I felt that having options for graphs was imperative to what I was envisioning.

What are some Python programming concepts that you understand *very well* after completing the project? Think about the programming aspects that you may not have understood fully had you not completed the project (2-3 sentences)

Answer: I understand how importing modules work. The installation and import method made a lot more sense to me after I spent more time researching and trying to understand what it actually did past the terminal.

What are some Python programming concepts that you do not fully understand (that you may or may not have used in your code)? Think about the aspects of your code that you find most difficult / challenging. (2-3 sentences)

Answer: File organization is probably something I don't properly understand yet. My program works well when the .txt or .CSV files are in their arranged format, but actually converting a file from unformatted to formatted isn't something I understand yet.

Rate the resources you used in your project as one of the four: Highly Valuable, Valuable, Not much valuable, Not valuable at all

Resource	Rating for how important this resource was for your project
Internet discussion forums (GitHub, StackOverflow, YouTube)	Highly valuable
AI tools (ChatGPT, Claude, Gemini etc.)	Highly valuable
Friends (EE 021 students, or other students on campus)	Valuable
Tutors (STEM tutoring center, online personal tutors)	Highly valuable

Class resources (slides, office hours, practice)	Valuable
Other:	Choose an item.

What features did you want to implement in your project but did not have the time / know-how to finish?

Answer: File organization so that you can input any .txt or .csv file without it bugging out.

Estimate the number of hours that you worked on the project (in total)

Answer: I did not measure exactly, but definitely in between 18-20 hours.

If you were to change / modify one aspect of the project logistics and how it was managed in the class, what would it be?

Answer: I would've measured my time exactly or created a steadier pace of work. I finished the project quite early.
